Singularly perturbed linear control systems have been traditionally studied with one-vector input that controls both the slow and fast state variables. Motivated by examples of real physical systems, in this paper we extend the study to corresponding two-vector input systems. We have identified several classes of real physical singularly perturbed systems that can be more efficiently controlled using two-vector inputs. In such systems, one vector input is used to control the slow state space

Highlights the Hamiltonian approach to singularly perturbed linear optimal control systems. Develops parallel algorithms in independent slow and fast time scales for solving various optimal linear control and filtering problems in standard and nonstandard singularly perturbed systems, continuous- and discrete-time, deterministic and stochastic, multimodeling structures, Kalman filtering, sampled data systems, and much more.
